

JCM DRIVE

OVERDRIVE & DISTORTION

The JCM DRIVE is a highly versatile and dynamic low to medium gain overdrive.

You can get a wide range of different sounds only by switching between the two gain voicing options JTM/JCM. The gain reaches from soft crunch to stronger and harder overdriven sounds with fat bass and screaming treble. The two gain voicing options are comparable to the sound of the JTM/JCM amplifiers.

With the special 3-band equalizer it's possible to create a powerful rock sound even if the amplifier is set to crystal clean - no more compromises between a good clean sound and a kick-ass rock distortion!

The mid-frequency range is the key element in your guitar sound. So we decided to come up with a toggle switch which allows you to choose between different center frequencies to cut/boost with the MIDDLE knob.

DYNAMIC switch:

The DYNAMIC switch features an electronic circuit which doubles the supply voltage to 18 volts internally. A higher supply voltage results in more headroom, clarity and greater dynamic response. Set the switch to the right to increase headroom and dynamic.

Power:

You have to insert a standard 9 volt DC power adaptor (2.1mm with negative tip) into the dc jack to power up the pedal. Alternatively, you can unscrew the bottom plate and access a 9 volt battery. Note that a connector has to be plugged into the INPUT jack to power the pedal in battery mode.

This unit runs off 9 volt DC only, do NOT use adaptors with higher voltages or alternating current (AC).

True bypass:

The ON/OFF footswitch operates as a hardware true bypass to guarantee best signal quality when unit is in bypass mode.

The JCM DRIVE uses a 100% pure analog circuit for the audio path.

OVERVIEW
