

DYNAMIC switch:

The DYNAMIC switch features an electronic circuit which doubles the supply voltage to 18 volts internally. A higher supply voltage results in more headroom, clarity and greater dynamic response. Set the switch to the right to increase headroom and dynamic.

Power:

You have to insert a standard 9 volt DC power adaptor (2.1mm with negative tip) into the dc jack to power up the pedal. Alternatively, you can unscrew the bottom plate and access a 9 volt battery. Note that a connector has to be plugged into the INPUT jack to power the pedal in battery mode. This unit runs off 9 volt DC only, do NOT use adaptors with higher voltages or alternating current (AC).

True bypass:

The ON/OFF footswitch operates as a true bypass to guarantee best signal quality when unit is in bypass mode.

The MORBID DRIVE uses a 100% pure analog circuit for the audio path.

MORBID DRIVE **HIGH GAIN DISTORTION**

The MORBID DRIVE is a versatile low/medium to high gain distortion.

You can get a wide range of different sounds only by switching between the two gain voicing options RHYTHM/LEAD. The amount of gain reaches from softer overdriven sounds up to modern high gain distortion with enough gain beyond good and evil.

With the special active 4-band equalizer it's possible to create a powerful distortion sound without fizzy, screaming highs even if the amplifier is set to crystall clean - no more compromises between a good clean sound and a kick-ass distortion!

The mid-frequency range is the key element in your guitar sound. So we decided to come up with a toggle switch which allows you to choose between different center frequencies to cut/boost with the MIDDLE knob.

OVERVIEW
